

Ideas:

- merging two platoons, i.e., joining several vehicles to one platoon (for a reference model check Grand Cooperative Driving Challenge - GCDC 2016)
 - parallel joining- we need some sort of assumption for joining vehicles. Lets assume a joining vehicle always adjust its position relative to the position of preceeding vehicle in the platooning
 - check Peleton technology for developing truck platooning tech.
- thinking of other applications of spatial and real-time model
